TASK: ANNOTATED BIBLIOGRAPHY.....	28

Week Two

Week 2: Lesson 1

Referencing & Plagiarism

Finding Sources

Most of the sources you'll need can be found in the library catalogue, although it's often easier to use Google Scholar initially.

- A: Google Scholar: <https://scholar.google.co.uk/>
- B: LSE Library Catalogue: [Search](#)
- C: Departmental Online Reading Lists: [Reading List | Find lists \(lse.ac.uk\)](#)
- D: Databases: [Databases \(lse.ac.uk\)](#)

Referencing

LSE does not have a single standard method for citing and referencing and Departments have different requirements. It is very important to check your student handbook or ask your academic supervisor to be clear on what is expected for your work.

If your department has not specified the referencing style, then it is your choice (APA 7 seems to be the most common). You should remain consistent and not mix your referencing styles. Choosing a specific style will make it easier to find and follow rules for each reference.

Common styles

- APA 7 [APA Style](#)
- Chicago [Chicago-Style Citation Quick Guide \(chicagomanualofstyle.org\)](#)
- Oscola (for law) [oscola_4th_edn_hart_2012.pdf \(ox.ac.uk\)](#)

Tools to help you cite:

Avoid copying the reference that's sometimes provided on Google Scholar and the Library Catalogue, as you will have a variety of different formats.

- The most commonly used software at LSE are: [EndNote](#), [Mendeley](#) and [Zotero](#). You can find tutorials on YouTube to help you.
- [Cite them right](#) is a website which contains advice on how to reference different resources, in a range of styles and provides a tutorial on citing and referencing practice.
- Reference management software can help you cite and reference consistently. Use software to collect, store and organise your references as you research. Then you can insert your citations using the software and build your reference list as you write your assignment.

Plagiarism

The passage below has been rewritten in seven different ways. Read the passage and then read each of the others. Decide if each of the rewritten versions has plagiarised the original.

As with innovation, no matter how important identifying opportunity is to the entrepreneurial process, it cannot be all that there is to it, nor can it characterise it uniquely. The entrepreneur cannot stop at simply identifying opportunities. Having identified them, the entrepreneur must pursue them with a suitable innovation. An opportunity is simply the 'mould' against which the market tests new ideas. In fact, actually spotting the opportunity may be delegated to specialist market researchers. The real value is created when that opportunity is exploited by something new which fills the market gap.

Philip A. Wickham, *Strategic Entrepreneurship* (London: Pitman, 1998), p. 8.

1. The entrepreneur cannot stop at simply identifying opportunities. Having identified them, the entrepreneur must pursue them with a suitable innovation. An opportunity is simply the 'mould' against which the market tests new ideas. In fact, actually spotting the opportunity may be delegated to specialist market researchers. The real value is created when that opportunity is exploited by something new which fills the market gap.
2. Wickham (1998:8) argues that the entrepreneur cannot stop at simply identifying opportunities. Having identified them, the entrepreneur must pursue them with a suitable innovation. An opportunity is simply the 'mould' against which the market tests new ideas. In fact, actually spotting the opportunity may be delegated to specialist market researchers. The real value is created when that opportunity is exploited by something new which fills the market gap.
3. No matter how important identifying opportunity is to the entrepreneurial process, it cannot be all that there is to it. The entrepreneur cannot cease at simply identifying opportunities. Spotting the opportunity may be delegated to specialist market researchers. The actual value is created when that opportunity is exploited by something new which fills the market gap (Wickham, 1998:8).

4. Likewise with innovation, no matter how important identifying opportunity is to the entrepreneurial process, it cannot be all that there is to it, nor can it characterise it uniquely. The entrepreneur cannot cease at simply identifying opportunities (Wickham, 1998:8).
5. "No matter how important identifying opportunity is to the entrepreneurial process, it cannot be all that there is to it. The entrepreneur cannot stop at simply identifying opportunities. Spotting the opportunity may be delegated to specialist market researchers. The real value is created when that opportunity is exploited by something new which fills the market gap" (Wickham, 1998:8).
6. "As with innovation, no matter how important identifying opportunity is to the entrepreneurial process, it cannot be all that there is to it, nor can it characterise it uniquely. The entrepreneur cannot stop at simply identifying opportunities. Having identified them, the entrepreneur must pursue them with a suitable innovation. An opportunity is simply the 'mould' against which the market tests new ideas. In fact, actually spotting the opportunity may be delegated to specialist market researchers. The real value is created when that opportunity is exploited by something new which fills the market gap" (Wickham, 1998:8).
7. Wickham (1998) argues that searching for and identifying market opportunities cannot be taken as an adequate definition of the entrepreneurial process. He points out that this function is one shared by market researchers. Wickham also insists that entrepreneurship involves going beyond the identification of a market gap since it includes exploiting that gap with what he calls 'a suitable innovation'.

Paraphrasing: key points to remember

An effective paraphrase:

- a) Changes the sentence structure of the original text.
- b) Changes vocabulary where appropriate (usually verbs, adjectives and adverbs) but does not change all words (e.g., specific terms like 'globalisation').
- c) Does not change meaning.

Below are two original texts. Bearing in mind the 3 key features of an effective paraphrase, choose which of the three student excerpts below each original is best.

Original 1

The best explanation for the British location of the industrial revolution is found by studying demand factors. By the early eighteenth-century high wages and cheap energy were both features of the British economy. Consequently, the mechanisation of industry through such inventions as the steam engine and mechanical spinning was profitable because employers were able to economise on labour by spending on coal. At that time, no other country had this particular combination of expensive labour and abundant fuel. (Allen, 2009)

Paraphrases

- a) Allen (2009) writes that a focus on demand may help to explain the UK origin of the industrial revolution. At the time workers' pay was high, but energy from coal was inexpensive. This encouraged the development of mechanical inventions based on steam power, which enabled bosses to save money by mechanising production.
- b) The reason why Britain was the birthplace of the Industrial revolution can be understood by analysing demand in the early 1700s, according to Allen (2009). He maintains that, uniquely, Britain had the critical combination of cheap energy from coal and high labour costs. This encouraged the adoption of steam power to mechanise production, thus saving on wages and increasing profitability.
- c) Allen (2009) claims that the clearest explanation for the UK location of the Industrial revolution is seen by examining demand factors. By the 18th century cheap energy and high wages were both aspects of the British economy. As a result, the mechanisation of industry through inventions such

as the steam engine and mechanical spinning was profitable because employers were able to save money on employees by spending on coal. At that time, Britain was the only country with significant deposits of coal.

Original 2

There are three main objections which can be raised against the death penalty. The first is that it is a cruel and uncivilized form of punishment unsuited to a modern state. Secondly, there is no evidence to suggest that it works by preventing others from committing similar crimes and lastly, there have been a number of high-profile cases where it has later been proved that someone else was guilty of the crime. (Anderson, 2007)

Paraphrases

- a) Anderson (2007) advances three arguments against the death penalty. He contends that the death penalty is inhuman and no society that purports to be civilised can condone it. It has also never been proved that the death penalty acts as a deterrent, and, furthermore, many innocent people have died in vain for the crimes committed by others.
- b) Anderson (2007) claims that there are three objections which we can be raise against the death penalty. Firstly, it is an uncivilized form of punishment inappropriate to 21st Century states. Secondly, there is no evidence to prove that it effectively prevents others from committing similar crimes. Finally, Anderson claims that there have been many cases where it has later been proved that executed convicts had been wrongly convicted.
- c) Anderson's (2007) three objections to the death penalty are, firstly, that it is "an uncivilized form of punishment" inappropriate to 21st Century states, secondly, much evidence proves that it does not prevent others from crimes, and, thirdly, there have been very many cases where the wrong person was executed.

Use of AI: Copilot

Over the past few years, AI's ability to paraphrase has improved dramatically. However, even if you do use such tools to assist you in your studies, it is always your responsibility to: a) ensure that you understand the meaning of the original, and b) to ensure that the paraphrase is accurate.

First, read the below quote from Ellemers (2018):

Stereotypes in general and gender stereotypes in particular may be helpful when there is a need to make quick estimates of how unknown individuals are likely to behave or when trying to understand how large groups of people generally differ from each other.

What does this mean? Discuss the meaning and write a paraphrase which summarises the key point.

When you finish, use Copilot (<https://copilot.microsoft.com/> - sign in with your LSE account) and ask it to offer you **five** different paraphrases.

With a partner, discuss each one, and see whether: 1) the order of information has been changed, 2) whether the language is sufficiently different, and 3) whether the meaning is the same as the original. Is there a good paraphrase? Is it better than yours?

Now type your own paraphrase into the AI tool – ask it for feedback. What does it say?

AI Reflections:

While AI tools are highly capable of generating accurate paraphrases; it's far better to use them as a tool to help improve your own paraphrases rather than write them for you. Be aware that AI:

- Ask **how** it would paraphrase a piece of text, rather than just asking it directly for the paraphrase.
- Ask it for feedback on your paraphrases: is the meaning the same as the original, is the structure/wording different, does it keep key terminology.

Week 2: Lesson 2

Referring to Literature & Reporting Verbs

Direct Quotations

Which of the following are good reasons to quote?

- a) to give a definition.
- b) to ensure that you represent an author's view precisely.
- c) to show respect to experts.
- d) to provide an interesting and important start or end to your essay.
- e) to establish or summarise an author's argument or position.
- f) the section that you wish to use is so short that it cannot be paraphrased.
- g) you haven't given enough time to reading and making notes, so it seems much easier to 'cut and paste' some quotations into your essay.
- h) to state a fact or idea that the author has expressed in a unique and powerful way.

Match one of the reasons to quote above with one of these extracts from a business ethics essay. Then answer the questions that follow:

1. Shaw and Barry (2007: 25) define business ethics as "the study of what constitutes right and wrong (or good and bad) human conduct in a business context". However, Ferrell and Fraedrich et al. (2002: 6) see business ethics as more proscriptive, defining it as the "principles and standards that guide behaviour in the world of business".
2. ... and led Hughes (2004) to criticise the perceived immoral character of modern business. Others share this view, such as Prindl and Prodham (1994, p.3), who suggest that "[f]inance as practised in the professions and in industry is seen as a valueless discipline that promotes efficiency without regard to the social consequences which follow from its products".
3. According to much of the literature, traits such as clear vision, the pursuit of excellence and a constant drive for innovation are highly valued. Yet, what is seldom addressed is that these very traits are not always positive and can have ill side-effects when wrongly applied. As Li (2003, p. 50) argues:

Power, perks, financial security, and recognition all seem to come with an executive title. Instructors cater to this motivation when they act as cheerleaders for prominent business leaders like Jack Welch or Kenneth Lay. They overlook the fact that the same qualities and strategies so often praised in business and other leadership literature can lead to disaster.

4. Indeed, the integration of ethics into all operations of a firm is essential; if these are decoupled, particularly among the leadership, the “consequences can be serious...even catastrophic” (Weaver, Trevino & Cochran, 1999:34).
5. Secondly, an even stronger argument for the view that good ethics in business do in fact exist is given by Collins (1994:2), who states that “good ethics is synonymous with good management”.

Questions

- a) In (1), why does the writer use two definitions? What do “25” and “6” refer to?
- b) In (2), why is the “f” in square brackets?
- c) In (3), what are the differences with the long quote? When should you use one?
- d) In (4), what does ... mean?
- e) In (5), what alternative verbs could the writer have used instead of “state”?

Read the examples below and note how the quotation can be embedded within a paragraph in various ways:

1. West (1994: 78) argues that “prior to the major state involvement in education in England and Wales in 1870, school attendance rates and literacy rates were well above 90 percent.”
2. West argues that “prior to the major state involvement in education in England and Wales in 1870, school attendance rates and literacy rates were well above 90 percent” (1994: 78).
3. According to West (1994:78), “prior to the major state involvement in education in England and Wales in 1870, school attendance rates and literacy rates were well above 90 percent.”

You may need to alter a quotation slightly to make it fit the grammar of your sentence.

- Wickham (1998:8) argues that “[the] real value is created when that opportunity is exploited by something new which fills the market gap.”
- The success was clear: the profit that they “create [...] when that opportunity is exploited” is great (Wickham,1998:8).
- Wickham (1998:8) argues that “[a]n opportunity is simply the 'mould' [...] actually spotting the opportunity may be delegated to specialist market researchers”.

For longer quotations (4 lines or more), the quote should be indented and is often written in a slightly smaller font and/or italics. In this case, quotation marks are unnecessary.

Note:

Paraphrasing and summaries are usually better than direct quotations because:

- They show you understand the material.
- They allow your ‘voice’ to emerge.
- They prevent your writing from turning into a cut and paste patchwork of source material.
- They are usually shorter and more concise.

TASK: Pick one of the sources you will use for your assignment. Use the space below to write a few direct quotes that may be useful for your essay. Try to incorporate some of the suggestions above: embedding; use of square brackets; indentation.

Referring to literature – Reporting Verbs

Quotes should never stand alone – if you're not paraphrasing, or incorporating them into your sentence, you'll need reporting verbs. These also help to add interest to your work, but, importantly, also give your reader more information about the **attitude of the source** you're using, as well as **your attitude** to that source. They add nuance.

Look at the extract below and highlight the reporting expressions:

In his book *Frameworks of Power*, Clegg (1989) carefully analyzes how social science has considered the concept of power. He discusses different frameworks and concepts to introduce his framework of circuits of power, which he claims includes most of the insights proposed by previous social scientists. Clegg argues that power is a relational concept. Hence power is something that cannot be owned, and its exercise will depend on relations. Clegg uses the circuits metaphor to emphasize the relational nature of power...The three circuits of power represent three types of power. Clegg formulates these to move away from Lukes' three-dimensional notion of power...Clegg derives his notion of episodic power from Dahl (1957). Dahl considers that A is exercising power over B when A gets B to do something B would not otherwise do. However, Clegg maintains that A would not be able to exercise power over B, if the standing conditions, which are constituted by resources, were not favourable to A.¹

- What tense is used for the reporting verbs above?
- Why is this particular tense used?
- What other tenses could be used with reporting verbs and why?

Most reporting verbs are in the present tense. Compare the below: can we make some general rules/observations about the effect of tense?

- Park & Jeong (1985) found that.... /Lee and Kim's (2018) study discovered that....
- Park & Jeong (1985) suggested that.../Park & Jeong (1985) suggest that...
- Lee and Kim (2018) attempted to.../ Lee and Kim (2018) comment that...

¹ Silva, L. and J. Backhouse (1997). *Becoming part of the furniture*. Information Systems and Qualitative Research. A. S. Lee, J. Liebenau and J. I. De Gross. London, Chapman & Hall: 395-396.

Reporting verbs also have different meanings. Read the sentences below (A, B, C) and match them to the correct statement (1, 2, 3...):

Statements

1. You are uncertain of this argument; perhaps you disagree or feel like it lacks sufficient evidence.
2. The source is voicing a strong opinion.
3. This source is arguing with another view.
4. This source has acknowledged problems/inaccuracies/shortcomings.
5. The source has given a possible solution / you feel that this is only one part of the problem.
6. A result is being stated.
7. This source does not change its view, or fully accept other views.

Sentences

- A. Shinzo (2011) argues that something as simple as decreasing household meat consumption will have a profound and positive impact on the environment.
- B. A possible explanation lies in the structure of the organisation; Zheng (2014) suggests that radical changes should be openly embraced by senior management in order to be more successfully adopted.
- C. Hadley (2020) claims that the British government could not have done more to prepare for the impact of Brexit.
- D. Although Keppler (2017) admits several limitations to the study, the overall findings support existing academic consensus.
- E. The research found that the majority of the staff were unhappy with the company's salary distribution policies.
- F. Sanchez (2019) maintains that social media is the largest threat to fair politics and should be subject to stricter legal limitations.
- G. The findings published by Bradley et al. (2019) have been largely accepted. Singh and Cooper (2020), however, contend that their wider application is not always applicable.

Reporting verbs can be roughly divided into three groups: strong, neutral and tentative. Can you add any more to the table below?

Strong	Neutral	Tentative
argues maintains contends claims admits	finds	suggests

Reporting verbs may look similar, but that doesn't mean they're interchangeable – take a moment to check that the meaning is what you want. What are the differences between these words?

notes/highlights

describes/analyses

suggests/speculates

Grammar

Most reporting verbs can be followed by a 'that' clause e.g. X argues / suggests / maintains / believes / denies / states **that the system has failed.**

Some must be followed by a noun or noun phrase e.g. X discusses **the reasons for** the failure of the system. Further example are given below:

Define	Challenge	Defend	Endorse	Put forward
Reject	Support	Present	Illustrate	Substantiate
Evaluate	Investigate	Investigate	Apply	Study
Take issue with	Verify	Refute	Analyse	Observe
Rebut	Posit	Underscore	Alludes to	Validate

Various patterns exist, so it is important to see reporting expressions in context.

Circle the best verb for these sentences:

Verb Pattern	Sentence		
Verb + that + noun phrase	Barker (2001)	claims challenges refutes	that these results are false.
Verb + noun phrase + infinitive	Both writers	take issue with advocate believe	such theories to be based on an essentially Marxist view of history
Verb + noun phrase + as ADJ (phrase)	Higgins (2002)	examines rejects endorses	this notion as impossible in the physical world.
Verb + verb-ing (phrase)	Zimmer (2003)	suggests states concedes	rethinking the current approach

EXERCISE

Think about the sources you have read so far for your Topic Input sessions (either this week or last week), or during the research you have done for your final assignment.

Using a mix of tentative/neutral/strong reporting verbs, write **five** reporting sentences.

e.g. Wooster (2008) argues that water management policies remain inadequately developed in the UK.

A list of reporting verbs².

A: Neutral verbs and expressions	According to	Describe	Comment (that)
	Define	Point out	Discuss
	Note (that)	Say (that)	State (that)
B: Verbs and expressions that indicate an author's position on an issue	Allege (that)	Argue (that)	Assert (that)
	Challenge	Claim (that)	Concede (that)
	Defend	Doubt (that)	Emphasise (that)
	Endorse	Take issue with	Maintain (that)
	Put forward (that)	Take the line that	Reject
	Refute	Recommend (that)	Support
	Advocate the position (that)	Suggest (that)	
C: Verbs that	Assume (that)	Believe (that)	Consider (that)

² This list is taken from: EDU Education Development Unit (2003) "Acknowledging Sources" <http://education.fce.unsw.edu.au> [accessed 7th November 2006]

indicate the author's thinking	Predict (that)		
	Hypothesise (that)	Think (that)	Recognise (that)
	Take for granted (that)		Acknowledge (that)
D: Verbs that indicate the author is showing something	Demonstrate (that)	Explain (that)	Illustrate (that)
	Indicate (that)	Present	Show (that)
E: Verbs that indicate the author is proving something	Confirm (that)	Establish (that)	Prove (that)
	Substantiate	Validate	Verify
F: Verbs that indicate what the author did	Analyse	Apply	Estimate
	Evaluate	Examine	Find
	Investigate	Observe	Study

Week 2: Lesson 3

Synthesis

Synthesis means “drawing connections between ideas”. In writing, it refers to organising the information you’ve read or discovered and weaving it together into a narrative. It’s the ability to combine or contrast the views of others with your own.

Summary and **paraphrase** form ideas in your own words; **synthesis** presents them with your voice.

Below is a literature review paragraph by an LSE student, containing many effective synthesis strategies.

Read through it:

- Do you ‘hear’ the *sources* speaking, or do you ‘hear’ the *writer* ‘speaking’?
- Think about who controls the narrative and how.

Title: Artificial Intelligence in Radiology – An Affordance Perspective

The medical sector is predominantly interested in two application areas: First, natural language processing transforms unstructured data, such as clinical notes, into a more structured format. Second, the analysis of structured data has the potential to facilitate the diagnosis process (Jiang et al., 2017). Scholars seem to be especially interested in developing AI use cases for the latter, as major causes of death, such as cancer, nervous system diseases and cardiovascular diseases, are diagnosed through image analysis by radiologists. Thus, a large proportion of literature in this regard is rooted in computer science and deals with the accuracy achieved by the underlying algorithms in detecting corresponding anomalies (Yao et al., 2020; Steinkamp et al., 2019; Khara et al., 2019). The factor of accuracy is important because AI is envisioned as tool supporting physicians in decision making (The Economist, 2018; Kahn, 2019; Mesko et al., 2018). The literature further highlights several reasons why health professionals may seek such decision aid. The amount of information has increased significantly over the last few years. Radiologists are estimated to view 4,000 images in a CT pan-scan of a trauma patient (Jha and Topol, 2016). As a result of the increased demand on physicians, they put significant cognitive effort in selecting the relevant heuristic approaches. However, using heuristics introduces bias in medical reasoning. Thus, conceptual and procedural

errors may occur (Patel et al., 2009). AI is said to be less susceptible to such biases, and therefore could improve patient safety by eliminating human errors (Dilsizian and Siegel, 2014). Moreover, this technology has the potential to increase the speed of the diagnosis process as well as reduce the cost in providing care (Jha and Topol, 2016; Mesko et al., 2018, Jiang et al., 2017). Simultaneously, scholars are also urging to question AI's 'hype' and evaluate its limitations (Emanuel and Wachter, 2019; Dhar, 2016). For example, Lebovitz et al. (2020) conclude that AI actually increases ambiguity, as its results often contradict the judgement of physicians. Furthermore, regulatory and medicolegal challenges as well as privacy and security concerns prevent widespread adoption of AI in hospitals (Dilsizian and Siegel, 2014). Consequently, more project-based, experimental approaches are pursued, in which primarily the accuracy of the technology is assessed. Therefore, it seems that the literature has not yet fully explored how health centres actually implement and work with this contemporary technology.

In groups, highlight any feature you notice that demonstrates synthesis (the cohesion of ideas). This could be whole sentences, specific words, punctuation, etc.

There are 7 main features to look for.

1. Generalisations ('scholars', 'recent research', 'the body of literature', 'academics').
2. Paraphrase + non-integral citations (at the end of the sentence).
3. Clustered citations (X, 2009; Y, 2014; Z, 2019.)
4. 'Consequence/result' markers that show you've drawn the information together to make a point.
5. Using your own words.
6. Framing paragraphs with strong topic sentences.
7. Conclude with a sentence that summarises the paragraph's gist.

Note: Although you can (& should) occasionally pick out individual sources as examples (with quotes/paraphrase) you'll notice most academic writing revolves around **paraphrase & summary**.

Skim read the altered sentences below - compared with the original text, does it affect you differently? If you were the tutor, what comments might you have?

The medical sector is predominantly interested in two application areas: First, natural language processing transforms unstructured data, such as clinical notes, into a

more structured format. Second, Jiang et al. (2017) point out that the analysis of structured data has the potential to facilitate the diagnosis process. Yao et al. (2020), Steinkamp et al. (2019) and Khara et al. (2019) seem to be especially interested in developing AI use cases for the latter, as major causes of death, such as cancer, nervous system diseases and cardiovascular diseases, are diagnosed through image analysis by radiologists. Thus, a large proportion of literature in this regard is rooted in computer science and deals with the accuracy achieved by the underlying algorithms in detecting corresponding anomalies. Mesko et al. (2018) state that the factor of accuracy is important because AI is envisioned as tool supporting physicians in decision making. Jha and Topol (2016) further highlight several reasons why health professionals may seek such decision aid. The amount of information has increased significantly over the last few years. Radiologists are estimated to view 4,000 images in a CT pan-scan of a trauma patient.

In groups, discuss the following question: “What do you think increasing automation means for the future of work?”

Read these excerpts from academic articles about the future of work and note down the key points.

Then write a short, synthesised paragraph on this topic.

Text 1:

Frey, C. & Osborne, M. (2017) ‘The future of employment: How susceptible are jobs to computerisation?’ Technological Forecasting & Social Change, 114, pp. 254-280.

While computerisation has been historically confined to routine tasks involving explicit rule-based activities (Autor and Dorn, 2013; Autor et al., 2003; Goos et al., 2009), algorithms for big data are now rapidly entering domains reliant upon pattern recognition and can readily substitute for labour in a wide range of non-routine cognitive tasks (Brynjolfsson and McAfee, 2011; MGI, 2013). In addition, advanced robots are gaining enhanced senses and dexterity, allowing them to perform a broader scope of manual tasks (IFR, 2012b; Robotics-VO, 2013; MGI, 2013). This is likely to change the nature of work across industries and occupations.

...According to our estimates around 47% of total US employment is in the high risk category. We refer to these as jobs at risk – *i.e.* jobs we expect could be automated relatively soon, perhaps over the next decade or two.

Our model predicts that most workers in transportation and logistics occupations, together with the bulk of office and administrative support workers, and labour in

production occupations, are at risk. These findings are consistent with recent technological developments documented in the literature. More surprisingly, we find that a substantial share of employment in service occupations, where most US job growth has occurred over the past decades (Autor and Dorn, 2013), are highly susceptible to computerisation. Additional support for this finding is provided by the recent growth in the market for service robots (MGI, 2013) and the gradual diminishment of the comparative advantage of human labour in tasks involving mobility and dexterity (Robotics-VO, 2013).

Text 2:

Spencer, D. A. (2018) 'Fear and Hope in an Age of Mass Automation: Debating the Future of Work' New Technology, Work and Employment, 33(1), pp. 1-12.

There is now renewed interest in the topic of automation. The advance in new digital and robotic technologies, it is claimed, will bring forth a future of less work. While history has disproved predictions of work's demise via automation, it is now argued that this time will be different and the days of work are numbered. Notably, writers from across the intellectual and political spectrum have seized on the prospect for the disappearance of work. Some worry about the negative effects on unemployment and inequality, while other more radical voices see the opportunity for a move beyond work and the creation of a world of abundant free time. In both instances, however, there is confidence that work will decline in the future.

This paper has addressed concerns around the automation of work...While average work hours have fallen in capitalist economies, they have not fallen by as much as productivity growth. More broadly, work has continued to dominate human life, despite rapid progress in technology.

The paper has shown how the same barriers to working less are likely to remain in the future, undermining predictions of the demise of work. Indeed, developments in technology are very likely to create more work for people to do. This reflects on the capacity of capitalism to use technology in ways that sustain and multiply work. While technology evolves under capitalist social relations, there will be a tendency for it to

keep workers in work and to deny the extension of free time. It has been argued that the concern with technology is less with its impact on the volume of work and more with its effects on the quality of work. The latest digital technologies are already being used to create a more disposable, insecure and exploited workforce. Their extended use in the future threatens to subject more workers to even worse quality work.

The problem is not technology itself, but rather the harnessing of it under capitalism. The bias towards the use of technology for profit-making, specifically, means that workers cannot rely on technology to reduce the burden of work and to enhance the

qualitative content of work. Rather their only hope for securing less and better work is to see technology pass from the direct control of capitalist employers. As stressed above, and in line with arguments made by Marx, the quest for a more humane work environment—one that supports extended free time while encouraging more intrinsically rewarding work—requires changes in ownership that cede power to workers over the use of technology. It is not utopian to imagine an automated future where work is diminished and also enhanced in qualitative terms; however, to realise this future, society must undergo radical change—in particular, it must accommodate a shift towards worker ownership.

Text 3:

Ford, M. E. (2009), *The Lights in the Tunnel: Automation, Accelerating Technology and the Economy of the Future*. Acculant: USA.

The economy will always create new jobs; we will never have structural unemployment as a result of advancing technology.

At present, I suspect that most economists would probably be likely to agree with this statement [‘the economy will always create new jobs’], and, therefore, disagree with what I have suggested in this book. Here in a nutshell, is my argument for why I think we *will* end up with a serious unemployment problem.

As technology advances and industries automate, this improves the efficiency of production and tends to make the products and services produced by those industries more affordable. That leaves more purchasing power in the pockets of the consumers. Those consumers then ... spend that extra money on all kinds of products and services produced by a variety of industries. Some of those industries are relatively labour intensive, so they have to hire more workers to meet this demand – and so overall employment remains stable or increases. This is the reason (p. 211) that, historically, technology has not led to sustained, widespread unemployment.

My argument is that accelerating automation technology will ultimately invade many of the industries that have traditionally been labour intensive. Additionally, the process of creative destruction will destroy old industries and create new ones, and very few of these new industries are likely to be labour intensive. As a result, the overall economy will become less labour-intensive and ultimately reach a “tipping point.” Beyond this point, the economy will no longer be able to absorb the workers who lose jobs due to automation: businesses will instead invest primarily in more machines. I have also argued that this process will be relentless, and if it is not

[illegible]

Week 2: Lesson 4

Sources

Academic sources take many forms and provide the evidence needed to validate your research. Using a wide range of credible sources will help to develop and support your argument.

Those you locate in the Library Catalogue and most of those on Google Scholar will be reliable, however you will sometimes be required to critically evaluate them, their context, and the contribution they make.

Can you think of some areas? What do you think you should consider when critically evaluating a source? Discuss some ideas on your tables.

Some dimensions you can consider are presented in the CRAAP framework:

- C Currency
- R Relevance
- A Authority
- A Accuracy
- P Purpose

C: Currency relates to the date of the source

Some questions to ask yourself when determining the currency of a source:

- What is the date of the information?
- Has the information been updated?
- If the information isn't recent, does this matter i.e. is this information still relevant if it is an older source?

R: Relevance relates to a source's suitability for your research and audience

Some questions to ask yourself when determining the relevance of a source:

- Does the source help to develop your argument?
- What do other sources say? Is your current source still relevant?
- Are there other more relevant sources?

A: Authority relates to the source of the information

Some questions to ask yourself when determining the authority of a source:

- Who is the author/publisher/organisation producing the information? What are their credentials? Is it easy to find out more about the author/publisher/organisation?
- What qualifies them to produce information on this subject?

A: Accuracy relates to the trustworthiness of the source

Some questions to ask yourself when determining the accuracy of a source:

- Where does the information come from?
- Is the language error free? Is the tone balanced?
- What do other reliable sources say about your chosen source? You may want to read some reviews of your source to check this.
- What references does your source use? Are these correct and reliable? Sources with no references or with incorrect or skewed information may not be accurate.

P: Purpose relates to the point of the research

Some questions to ask yourself when determining the purpose of a source:

- Why was the research disseminated e.g. to inform, sell, persuade, guide, entertain? Is its purpose clear?
- Does the purpose of the research fit your own research agenda?
- Is the information impartial?
- Is the information factual or opinion?

Annotated Bibliographies

An annotated bibliography is a list of cited sources (books, articles, reports etc.) that are followed by a brief summary of its contents.

Steps to creating an annotated bibliography:

1. Locate possible sources which you think will be relevant for your essay
2. Briefly examine and review your chosen sources, deciding which are most relevant for your topic
3. Cite your chosen resource using the correct referencing style
4. Write an annotation which summarises the main idea or scope of your chosen source. This annotation should be between 100 and 300 words. It should include:
 - A description of the theoretical background of the author: how authoritative are they within their field?
 - An indication of the intended audience
 - A summary of its contents
 - The main idea, argument or theme of the source
 - An evaluation of its relevance, strengths, potential weaknesses and limitations, an indication of methodology (if relevant) etc.
 - An indication of useful ideas or materials in the source that you may use in your work

Language and Style

Annotated bibliographies should be formal in style and language used. Your style should be objective and factual, drawing on reporting verbs to indicate the author's argument. You can choose to write in full sentences or in clear bullet pointed lists, addressing the above criteria, whichever style you choose, be consistent!

NOTE: Synthesis / Criticality

While it is not part of the annotated bibliography assignment, as you read your chosen sources (and others) it is always a good idea to keep an eye out for signs of relationship between them: **where do they agree on topics/ideas? Where do they differ? Does one support or build on another? Etc.**

Below are some extracts of student annotated bibliography entries. What would you say were the strengths and weaknesses?

Extract 1:

Impact of the COVID-19 Pandemic on Online Consumer Purchasing Behaviour

With the spread of the COVID-19 pandemic and the increasing importance of e-commerce, the study of online consumer behaviour is of particular relevance. The purpose of this study was to form a methodological approach to assess the relationships and the level of influence of the factors activating the purchasing behaviour of online consumers against the background of the COVID-19 pandemic. The research methodology was based on the transformation of Cattell's questionnaire and the implementation of correlation analysis. To determine the predisposition of online consumer behaviour at the time of making a purchase decision, this study used the questionnaire method. The survey was conducted among online shoppers in the top 10 countries in terms of e-commerce market growth. The scientific contribution is the proposed methodological toolkit to assess the purchasing behaviour of online consumers, which identifies the most influential factors in their purchasing behaviour and provides an opportunity to assess the dynamics of their activity during the study period, to identify key trends and determine changes in their behaviour. The research revealed what changes in online consumer buying behaviour are typical in the COVID-19 pandemic. The impact of consumer awareness and experience has increased. Online consumers have become more experienced, which has influenced the activity of their buying behaviour. This study proved the shifting influence of online consumer purchasing behaviour factors during the pandemic. The increasing importance of the speed of decision making by consumers when purchasing goods and services online was determined.

Extract 2:

Cultural capital: Bourdieu, P. (2011). The forms of capital.(1986). Cultural theory: An anthology, 1, 81-93.

Bourdieu regards people's lives as a combination of various fields and uses capital as a tool for the analysis of human society. He proposes that capital, which is exclusive, is the materialisation of labour and the result of historical accumulation. Cultural capital is premised on internalisation, and the family is an important field for the transformation of economic capital into cultural capital. Cultural capital is continuously reproduced through the intergenerational transmission of parenting and investment in education.

Bourdieu's theory demonstrates that social structures and cultures are self-replicating processes and that capital perpetuates privilege and inequality with class

habitus. The theoretical perspective is unique and clearly illustrates that people carry out social activities in the field, while competing for and appropriating capital. There are also some problems with the theory. Bourdieu overemphasises the stable side of society and fails to realise that society is fluid. For example, Pareto's theory of elite circulation explains that upper and lower classes are open to interchangeable status. Bourdieu ignores the dynamic nature of people and does not accept that people in lower classes can work their way up to higher classes.

Extract 3:

Priceless data: why the EU fundamental right to data protection is at odds with trade in personal data Bart Custers, Gianclaudio Malgieri

The authors of the essay are Bart Custers & Gianclaudio Malgieri are established scholars in the field of data protection, privacy, and law, who are known for their research on the legal and ethical aspects of information technology, data protection, and artificial intelligence. The article explores the tension between the fundamental right to data protection, as guaranteed by EU data protection law, and the commercial models, which disqualifies personal data as a commodity. The main idea of the article is to analyze and discuss how users would retain their inalienable data subject rights to stop or restrict the data processing, as the GDPR does not allow mandating data. What is worth mentioning is that it also reflects if people invoke their data subject rights on the legal basis of consent at any time, considerable legal uncertainty may be triggered in transactions, particularly on the side of data controllers, potentially undermining EU's envisioned data economy. This source is likely to be relevant for scholars, researchers, policymakers, data giants and legal practitioners interested in the intersection of data protection rights and the trade in personal data within the European Union context. Through understanding legal mechanisms employed by the EU to protect personal data, as well as the challenges posed by the commercial trade in personal data, I can further learn from innovative solutions proposed by the authors and discussions on potential reforms, regulatory gaps.

OF ECONOMICS AND
POLITICAL SCIENCE ■

Task: Annotated Bibliography

On Moodle you need to submit an annotated bibliography for THREE of the texts you will use for your assignment.
